

Flushing Triple System with FL051 Fluoride Cartridge Filter

Insert new 1025PS1 Sediment filter into Stage I of filter housing

Remove your WC04 Carbon filter from Stage III of the housing and screw back on the empty sump. Insert new FL051 Fluoride cartridge into Stage II.

Turn on the filter tap or diverter valve on the sink and leave open before turning on water each time you flush cartridges. This will stop any air from being trapped in the filters causing white or cloudy water.

Flush 5 – 10 litres of water, or until water runs clear of any residue.

Replace the WC04 into Stage III after flushing the fluoride filter.

Flush again 5 – 10 litres to remove any trapped air and carbon fines from the WC04 filter.

Once the water runs clear your system is ready to use.

Stage I	1025PS1	Sediment Filter
Stage II	FL051	Fluoride Filter
Stage III	WC04	Carbon Filter
